

3D Multimodal Co-Registration of the Macaque Brain

DREW FREYBERGER

DUKE UNIVERSITY: SOMMER LAB

JANUARY 28, 2016

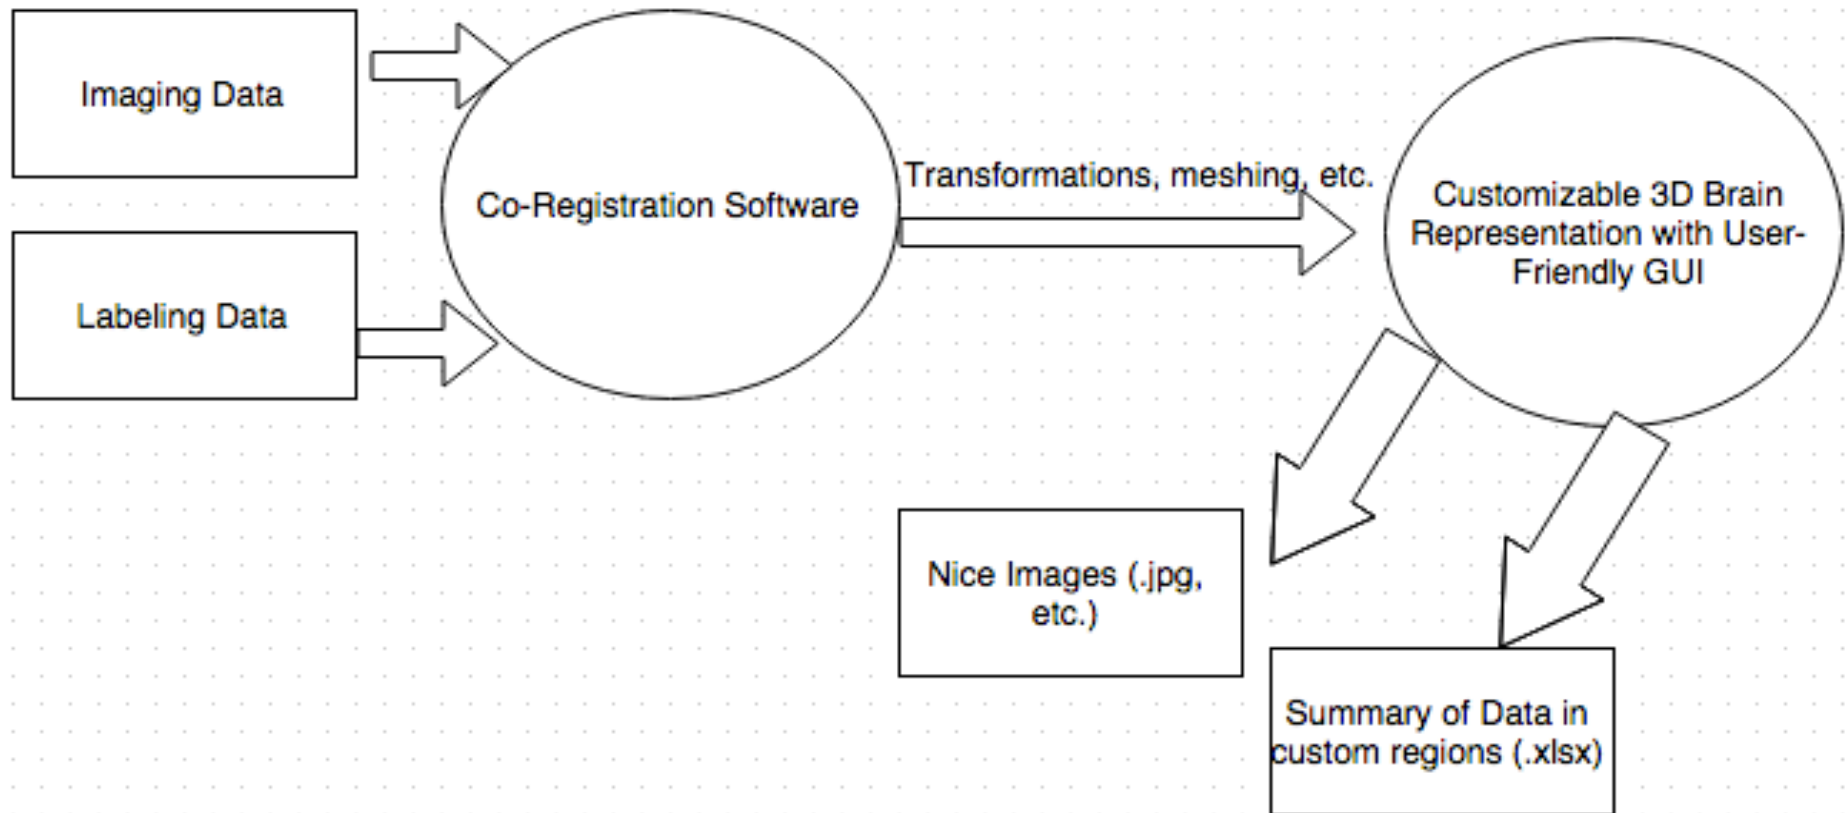

Sommer Lab: Electrophysiological Recordings in the Cerebellum

- Goal is to understand neuronal circuits of the brain
 - Learn how individual areas process signals
 - Learn how multiple areas interact to cause cognition
- Record at the single neuron level

Project Goal:

Create a procedure for the lab to use to visualize recording sites

MonkeyCicerone Software

- Developed by University of Minnesota
- Co-registers MRI, CT, 3D atlas, MER data, chamber location, and DBS electrodes with VTA predictions
- Limitations: no posterior cerebellum, DICOM input issues, and chamber rotation coordinate issues

3D Posterior Cerebellum Creation

- Successive cross-sections of the posterior cerebellum were traced in Rhino3D
- The sections were taken from a Rhesus macaque 2D brain atlas
- Once all cross-sections were positioned, the structure was lofted and smoothed

3D Posterior Cerebellum

- To personalize the Cicerone software for the Sommer Lab, a 3D posterior cerebellum was added using 2D MRI, CT and MER data.

Fixing the Chamber Rotation Coordinates Issue

	A	B	C	D	E	F	G	H
1	Filename	Chamber Rotation	Monkey	Chamber Location	M-L	A-P	Theta	Hypotenuse
2	R83L4A0_19100	20	Rigel	L4A0	4	0	-20	4
3	R83L4A0_19400		Rigel	L4A0	4	0	0	4
4	R140L6A1_20160		Rigel	L6A1	6	1	9.4623222	6.08276253
5	R132M8A3_20100		Rigel	M8A3	-8	3	-20.55605	8.544003745
6	R81M3P5_15100		Rigel	M3P5	-3	-5	59.036243	5.830951895
7	R832M4P4_13000		Rigel	M4P4	-4	-4	45	5.656854249
8	R232L4A2_10000		Rigel	L4A2	4	2	26.565051	4.472135955

I	J	K	L
ML Coordinate	AP Coordinate	Calibration (mm)	Depth (mm)
3.758770483	-1.368080573		19.1
4	0		19.4
6	1		20.16
8	-3		20.1
3	5		15.1
4	4		13
4	2		10

Cicerone does not account for chamber rotations used in the Sommer Lab, so an easy-to-use Excel input file was developed to automatically translate the brain coordinates into Cicerone coordinates.

Fixing the DICOM Input Issue

```
1 function sort_asf29_cd(realtopdir,dest_folder_str)
2 %Summary of this function goes here
3 % Detailed explanation goes here
4
5 now=cd;
6 cd(realtopdir)
7 nfwrit=0;
8 topdir=dir;
9 destdrive=strcat(dest_folder_str);
10
11 for tdn=4:4
12     cdname = strcat(realtopdir, topdir(tdn).name);
13     padir = dir(cdname);
14
15     for pdn=3:length(padir)
16         pname = strcat(cdname, '\', padir(pdn).name);
17         stdir = dir(pname);
18
19         for stn=3:length(stdir)
20             sename = strcat(pname, '\', stdir(stn).name);
21             sedir = dir(sename);
22
23             for sen=3:length(sedir)
24                 selsen = strcat(sename, '\', sedir(sen).name);
25                 iis = dicominfo(selsen);
26                 destfile = strcat(destdrive, '\', iis.SeriesDescription, num2str(iis.SeriesNumber));
27
28                 if ~exist(destfile)
29                     mkdir(destfile);
30                 end
31                 copyfile(selsen, destfile)
32                 nfwrit=nfwrit+1;
33             end
34         end
35     end
36
37 end
38 end
39 cd(now)
40 end
```

Cicerone accepts only a certain DICOM file type, so a MATLAB script was developed to automatically sort the DICOM files into Cicerone-readable folders.

Results

Summary:

- Successfully built a brain visualization process in Cicerone
- University of Minnesota has communicated that it intends to adopt the cerebellum visualization into its next Cicerone software update
- Future improvements will include adding more features (histology, etc.)
